NEUROGENETICS RESEARCH LIMS

Pedigree-aware laboratory tracking for translational genetics

LABORATORY OVERVIEW • SAMPLE WORKFLOW • CAPTURED FROM THE RUNNING APPLICATION

THE SYSTEM

Neurogenetics Research LIMS

A laboratory information management system for translational genetics. Families are modelled as real pedigrees — individuals, relationships, probands — so a sample is never just a barcode but a person inside an inheritance pattern. Tracks samples through extraction and sequencing, records variants against a disorder dictionary, and exports family data for analysis.

BUILT FOR	Genetics labs, Quaid-e-Azam University · originally commissioned by Prof. Sundas Farooq
CORE	Pedigree graph, sample workflow states, variant calls, stored file vault, disorder reference
NOTABLE	Interactive pedigree renderer driven from live relationship data
STATUS	In production
FIELD	Healthcare & labs

BUILT WITH

Django · Python · MySQL · Class-based views · Custom auth model

WORK WITH ME

Healthcare & laboratory software

I build line-of-business software for organisations that cannot afford it to be wrong. This project is one of 32 systems I have delivered; four are running in daily production.

- Blood bank, laboratory and hospital information systems with full audit trails.
- Sample and specimen tracking from intake through result, with status workflows.
- Role-based access, chain-of-custody logging and printable clinical reports.
- Migration of paper registers and spreadsheets into a real database.

HOW I WORK

- I work close to the people who will use the system, not from a spec document alone.
- You get the source, the database schema, and a local setup that actually runs.
- Clear milestones, and a demo build you can click through at each one.
